

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

IN THE CLAIMS

Please substitute the following claims for the pending claims with the same numbers respectively:

Claim 1 (Currently amended): A semiconductor memory card which is used in connecting to an access device, comprising:

a host interface which transmits a control signal and data to the access device and receives a signal from the access device;

a nonvolatile memory in which a plurality of continuous sectors are grouped into an erase block as a minimum unit for data erasing and which includes an address management information area and user data area;

a memory controller which controls erasing, writing and reading of data for said nonvolatile memory;

a memory for card information storage including a card information storage part which stores information on access ~~performance of said nonvolatile memory;~~ condition as condition at least at the time when said access device accesses said semiconductor memory card and access performance which said

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

semiconductor memory card realizes when said access device  
performs access on said access condition, and

a control part which controls each part on the basis of the control signal acquired via said interface, ~~reads the information on the access performance of said card information storage part and transmits the information to said access device.~~

Claim 2 (Currently amended): The semiconductor memory card according to claim 1, wherein said card information storage part stores

first information on physical characteristics of in said semiconductor memory card, and at least one of

second information on access condition ~~when accessing said semiconductor memory card,~~

third information on said access rate of said semiconductor memory card as information on said access performance, and

fourth information on abnormal process of said semiconductor memory card.

Claim 3 (Original): The semiconductor memory card according to claim 2, wherein said third information in said card information storage part includes

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

a flag representing rate performance of said semiconductor memory card as said information on access rate.

Claim 4 (Currently amended): The semiconductor memory card according to claim 1, wherein said card information storage part stores at least

first information on physical characteristics in said semiconductor memory card,

second information on said access condition ~~when accessing said semiconductor memory card~~, and

third information on access rate of said semiconductor memory card as information on said access performance.

Claim 5 (Original): The semiconductor memory card according to claim 4, wherein

said control part, in response to a request from said access device, reads information on access condition for accessing said semiconductor memory card, and information on access rate when accessing to said semiconductor memory card on said access condition from said card information storage part, and transmits the information to said access device.

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

Claim 6 (Original): The semiconductor memory card according to claim 4, wherein

said control part, in response to information on access condition designated by said access device, reads information on access rate when accessing the semiconductor memory card on said access condition from said card information storage part, and transmits the information to said access device.

Claim 7 (Original): The semiconductor memory card according to claim 4, wherein

said control part, in response to information on access rate designated by said access device, reads information on access condition to said semiconductor memory card required to meet said access rate from said card information storage part, and transmits the information to said access device.

Claim 8 (Original): The semiconductor memory card according to claim 4, wherein

said control part, when reading information on access condition designated by said access device and information on access rate from said card information storage part and accessing said semiconductor memory card on said access condition,

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

determines whether or not the access rate is met and transmits a determination result to said access device.

Claim 9 (Original): The semiconductor memory card according to claim 4, wherein the third information in said card information storage part includes

a flag representing rate performance of said semiconductor memory card as said information on access rate.

Claim 10 (Original): The semiconductor memory card according to claim 4, wherein

said card information storage part has information on access rate of said semiconductor memory for a plurality of levels of power consumption of said semiconductor memory card as said third information, and

said control part, in response to a request from said access device and designation of power consumption level, reads information on access condition for accessing said semiconductor memory card and information on access rate when accessing said semiconductor memory card on said access condition from said card information storage part, and transmits the information to said access device.

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

Claim 11 (Original): The semiconductor memory card  
according to claim 4, wherein

said card information storage part has information on access  
rate of said semiconductor memory for a plurality of levels of  
power consumption of said semiconductor memory card as said third  
information, and

said control part, in response to information on access  
condition designated by said access device and designation of  
power consumption level, reads information on access rate when  
accessing said semiconductor memory card on said access condition  
and designated electrical power consumption level from said card  
information storage part, and transmits the information to said  
access device.

Claim 12 (Original): The semiconductor memory card  
according to claim 4, wherein

said card information storage part has information on  
access rate of said semiconductor memory for a plurality of  
levels of power consumption of said semiconductor memory card as  
said third information, and

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

said control part, in response to information on access rate designated by said access device and designation of power consumption level, reads information on access condition to said semiconductor memory card required to meet said access rate from said card information storage part, and transmits the information to said access device.

Claim 13 (Original): The semiconductor memory card according to claim 4, wherein

said card information storage part has information on access rate of said semiconductor memory for a plurality of levels of power consumption of said semiconductor memory card as said third information, and

said control part reads information on access condition designated by said access device and information on designation of power consumption level and access rate from said card information storage part, determines whether or not said access rate is met when accessing said semiconductor memory card on said access condition and designated electrical power level, and transmits a determination result to said access device.

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

Claim 14 (Original): The semiconductor memory card  
according to claim 1, wherein

said card information storage part has an access performance  
basic information list which holds various process time and  
process unit size in said semiconductor memory card according to  
an access method, and

in response to a request from said access device, said  
control part transmits said access performance basic information  
list to said access device.

Claim 15 (Original): The semiconductor memory card  
according to claim 1, wherein

said card information storage part holds process unit size  
of said semiconductor memory card, access method and access rate  
in the case where access condition containing process contents  
are changed, and

in response to request of said access device, said control  
part transmits information on said access rate to said access  
device.

Claim 16 (Currently amended): An access device for  
accessing a semiconductor memory card in which a plurality of

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

continuous sectors are grouped into a block as a minimum unit for data erasing and stored data is managed according to a file system comprising:

a card information acquisition part for acquiring information on access ~~performance of said attached semiconductor memory card~~ condition as condition at the time when said access device accesses said semiconductor memory card and access performance which said semiconductor memory card realizes when said access device performs access on said access condition from said semiconductor memory card;

a card use condition storage part for storing information on access condition which can be used when said access device accesses said semiconductor memory card and information on access rate desirable for said semiconductor memory card;

an access condition determination part for determining access condition on the basis of the information ~~on access performance of said semiconductor memory card~~ acquired by said card information acquisition part, ~~and~~ information on access performance of said semiconductor memory card and information stored in said card use condition storage part;

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

a file system control part for acquiring access condition determined by said access condition determination part and performing file access suitable for said access condition; and

an access control part for accessing said semiconductor memory card in response to an access request from said file system control part.

Claim 17 (Original): The access device according to claim 16, wherein

said access condition determination part divides an area of said semiconductor memory card in file system access units (hereinafter referred to as FS access unit) on the basis of the information on access performance acquired from said semiconductor memory card.

Claim 18 (Original): The access device according to claim 17, wherein

said file system control part, when recording file data on said semiconductor memory card, determines a continuous free area having a length of multiples of said FS access unit on the basis of management information of a file system constructed on said

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

semiconductor memory card, and records the file data in said determined continuous free area.

Claim 19 (Original): The access device according to claim 17, wherein

said file system control part, when recording new file management information on said semiconductor memory card, determines whether or not another file management information is recorded in the area of said FS access unit on the basis of management information of the file system constructed on said semiconductor memory card and a free area for writing new file management information therein exists, and when the free area exists, determines said free area as a writing position of file management information, and records the file management information in said determined free area.

Claim 20 (Original): The access device according to claim 17, wherein

said file system control part, when the areas of a plurality of said FS access units are partially used, moves data in the used areas of partially used FS access units to an unused area of

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

the other FS access unit on the basis of management information of a file system constructed on said semiconductor memory card.

Claim 21 (Original): The access device according to claim 17, wherein

said file system control part calculates the number of areas in which the whole of said FS access unit is the free area on the basis of management information of the file system constructed on said semiconductor memory card.

Claim 22 (Currently amended): An access method for accessing a semiconductor memory card in which a plurality of continuous sectors are grouped into a block as a minimum unit for data erasing and stored data is managed according to the file system comprising:

a card use condition storage step for storing information on access condition which can be used when accessing said semiconductor memory card and information on access rate desirable for said semiconductor memory card;

a card information acquisition step for acquiring information on access ~~performance of said loaded semiconductor memory card~~ on access condition as condition at the time when

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

said access device accesses said semiconductor memory card and  
access performance which said semiconductor memory card realizes  
when said access device performs access on said access condition  
from said semiconductor memory card;

an access condition determination step for determining  
access condition on the basis of the information ~~on access  
performance of said semiconductor memory card~~ acquired in said  
card information acquisition step and information stored in said  
card use condition storage step; and

a file system control step for acquiring access condition  
determined in said access condition determination step and  
accessing a file in said semiconductor memory card so as to meet  
said access condition.

Claim 23 (Original): The access method according to claim  
22, wherein said access condition determination step determines a  
file system access unit (hereinafter referred to as FS access  
unit) as a size used when accessing said semiconductor memory  
card according to said access condition.

Claim 24 (Original): The access method according to claim  
23, wherein

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

when recording file data on said semiconductor memory card, said file system control step determines a continuous free area having a length of multiples of said FS access unit on the basis of management information of the file system constructed on said semiconductor memory card, and

the file data is recorded in said determined continuous free area.

Claim 25 (Original): The access method according to claim 23, wherein

when recording new file management information on said semiconductor memory card, said file system control step determines whether or not another file management information is recorded in the area of said FS access unit on the basis of management information of the file system constructed on said semiconductor memory card and a free area for writing new file management information therein exists, and

when the free area exists, said space area is determined as a writing position of file management information and records the file management information in said determined free area.

Supplemental Preliminary Amendment  
Application No.: 10/567,241  
January 4, 2007

Claim 26 (Original): The access method according to claim 23, wherein when the areas of a plurality of said FS access units are partially used, said file system control step moves data in the used areas of partially used FS access units to an unused area of the other FS access unit on the basis of management information of the file system constructed on said semiconductor memory card.

Claim 27 (Original): The access method according to claim 23, wherein said file system control step calculates the size of an area in which the whole of said access unit is a free area on the basis of management information of the file system constructed on said semiconductor memory card, and

the calculated value is informed as a free area length of said semiconductor memory card to an application program.
